

Figure 3-32. Distribution of acoustic files since sunset for red bats at the 2002 and 1991 restoration sites, and the Phelan core sampling location. September 13 to October 21, 2002 refers to the entire study period, and September 13 to September 28, 2002 refers to the restoration plot study period only. For any instance of estimated time since emergence of less than 1 hour, that time, and an estimate of straight-line travel distance (using flight speed of 5 meters per second) is shown for an approximate scale of distances to roost sites.
